What is BlokQR?

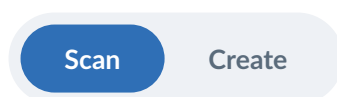

BlokQR is a QR code and barcode scanner built for your **security**. Its promise is simple: **the link inside a code is never opened on your phone**. Instead, its destination is analyzed remotely, and BlokQR returns a **signed verdict** - safe, caution, dangerous or malicious - before you ever tap.

Since version 2.0, BlokQR also makes you a **creator** of codes and an **assistant** that takes you straight to the right app based on what you scan.

In one sentence: you scan, BlokQR checks, and you decide - fully informed.

The two tabs

The whole app is built around two tabs at the bottom of the screen:

The floating bar: Scan on the left, Create on the right.

Scan

- Check a code
- Recognize a product
- Act on the content (call, open Maps, join a meeting...)

Create

- Generate QR codes and barcodes
- Link, contact, Wi-Fi, event...
- Personalize (color, logo), share or print

Getting started

1. **On first launch**, a short intro welcomes you. You can replay it anytime from "About".
2. **Allow the camera**: it is used only to read codes; no image is kept or sent.
3. **Point at a code** - analysis starts automatically.

Scan safely

Place the QR code or barcode in the viewfinder. If several codes are visible, tap the one to analyze. You can also analyze a code inside an **image** from your gallery.

What actually happens

The code is read on device; only its destination is checked, then a signed verdict is shown to you.

Understanding verdicts

Safe

Caution

Dangerous

Info

Safe

No threat detected. You can open the link (isolated sandbox or browser).

Caution

Suspicious link. Direct opening is restricted; possible only in the isolated browser.

Dangerous / Malicious

Confirmed threat: the link is blocked. You can report it to the community.

Info

Non-navigable content (number, coordinates, contact...). See "Act in one tap".

The sandbox opens the page in an isolated browser, in a separate process that holds none of your data - to look without risk.

Act in one tap

When a code's content calls for an action, BlokQR offers the **right button** to continue in the matching app. These actions open an editor or composer that you confirm: nothing is sent on its own.

Maps

Call

Email / SMS

Calendar

Meeting

GPS coordinates	Open in Maps button.
Phone number	Call button (opens the dialer - never calls on its own).
Email / SMS	Opens a pre-filled message to review before sending.
Contact / Event	Add contact or Add to calendar , pre-filled.
Meeting link	If the link is judged safe , a Join meeting button opens Zoom / Teams / Meet.

Security first: for web links (meetings included), the button appears only if the verdict allows it. A suspicious link stays blocked or confined to the sandbox.

Recognize a product

When you scan a **product barcode** (EAN/UPC), BlokQR shows its **GS1 origin** (the issuing organization) and, optionally, the **product name** via Open Food Facts.

Good to know: the prefix indicates the company's country of registration, which does not necessarily match the country of manufacture.

Receive a link to check

From any app (messaging, email, browser), use **Share → BlokQR** to analyze a suspicious link you received. BlokQR examines it at once, as if it had been scanned.

Tip: a long-press on the BlokQR icon opens shortcuts to Scan and Create.

Create your own codes

Generate a QR code or barcode in seconds: pick a content type, fill the fields, and the preview appears live.

Content types

- Link, text, phone, SMS
- Email, app, WhatsApp
- Contact, Wi-Fi, location, event

Formats

- QR, Data Matrix, Aztec, PDF417
- EAN-13/8, UPC-A/E
- Code 128/39/93, Codabar, ITF

1. Choose the type (e.g. Wi-Fi) then fill the fields (SSID, password...).
2. Pick a format if needed - QR fits almost everything.
3. Share or print the code. A smart phone field and a “My current location” button make entry easier.

Code color NEW

Give your QR codes some style: pick a **ready-made palette** or your **own colors** (modules and background). BlokQR checks **contrast live** to make sure the code stays readable by scanners; if contrast is too low, export is blocked. 1D barcodes (EAN, Code 128...) stay black and white, as readers require.

Center logo NEW

Add the **BlokQR logo in the center** of your QR codes with a single switch. Error correction is automatically raised so the code stays perfectly scannable.

Created-codes history

Every code you share or print is saved in the created-codes history (icon at the top of the Create tab). Tap an entry to regenerate the code, re-share it or delete it.

Encrypted and local: this history - which may contain Wi-Fi passwords - is encrypted on your device (hardware-backed key) and never transmitted. You can disable or clear it.

Personalize & protect

Theme	System, light, dark, warm or cold - instant change.
Language	12 languages available.
Scan history	Viewable, can be disabled, encrypted on device.
Biometric locks	Require your fingerprint to open the app and/or view history; a “secure screen” that hides the app in the recents view.
Product codes	Enable product recognition and, optionally, the online product name.

A polished start: animated splash screen, themed icon (Android 13+) that matches your wallpaper, and modern edge-to-edge display.

Free & Pro

Always free

- The code generator (color and logo included)
- Product recognition
- 7 verified analyses per day
- Offline protection

With Pro

- Unlimited analyses*
- Deep analysis: rendering, screenshot, advanced detection
- All detailed signals

*Up to 500 analyses per day (anti-abuse protection).

Same engine for everyone: the security decision is identical in Free and Pro. Pro only adds analysis depth.

Your privacy

- The scanned link is never opened on your phone.
- No account, no personal identifier, no advertising tracker.
- Your histories stay on the device, encrypted.
- Location is used only if you tap “My current location”, and stays local.
- The product name (option) sends only the barcode - non-personal data - to Open Food Facts.
